Hydroseeding

What is Hydroseeding?

Hydroseeding is a planting process that uses a mixture of seed, water, mulch and green dye. It is made in a tank with mixing blades that are mounted usually on trucks or trailers. The green dye is used to be able to see where it has been sprayed and to make sure we have maximum coverage.

This is then sprayed through a hose onto either residential or commercial lawn, slope or land. There is also a binder that is put into the hydroseed to allow it to stick to the ground and grow properly.

More Effective

Hydroseeding is almost always more effective than traditional broadcast seeding methods.

Even Distribution

Seed spreaders do a generally decent job of spreading the seed in a broadcast seeding application. However, in many cases, it's very difficult to know exactly what areas are covered and what areas aren't. This is never an issue with hydroseeding. The dye that is included in the slurry -- and for that matter, the process itself -- gives instant feedback to the spreader that there is in fact 100% coverage.

Hydroseeding is Quicker

All other things being equal (which they're not), hydroseeded lawns will also typically come in faster. In fact, it is not unusual to see early growth in five or six days. And of course, the faster a lawn comes in, the less worries there are for nurturing it through its critical stages of germination and early growth.

Biological ponds

Biological ponds and pools are ecological formations where water is cleaned by bacteria in the environment without any need of chlorine or any other chemicals. The cleaning of the water is achieved by the principle of reducing the algae concentration by microorganisms and balancing the phosphorus in the water.

Water, which is the source of life, has always been the most important natural substance that people live around, meet their physical needs and use it extensively in agriculture and cleaning. In addition to meeting the needs of creatures, water also constitute peaceful and harmonious landscapes to humans. By the help of developing technology now, it is possible to bring natural ponds to living spaces. Besides technology; stress, noise and disease are increasing nowadays. That is why ponds which creating peaceful and harmonious natural landscapes are no longer luxurious.

People who succeeded in carrying the tranquility and calming effect of water to their gardens, parks and all kinds of recreation areas turned away from nature when they used chemicals to protect the cleanliness of the water.

Vertical gardens

A vertical garden is a technique used to grow plants on a vertically suspended panel by using hydroponics. These unique structures can either be freestanding or attached to a wall. Vertical gardens have been used since ancient civilizations; many modern vertical gardens can last for decades and give a pop of nature into the modern day business.

Vertical gardens are a wonderful alternative to potted plants in the office space. While potted plants have the advantage of being placed anywhere, they can take up space and require lots of maintenance. However, with vertical gardens there is only one large panel to maintain, and it will provide a lush pop of color to any professional environment.

Vertical gardens can be placed in hotel lobbies, major corporation headquarters, or even a small residential backyard. Vertical gardens not only look impressive, but will also make you feel more comfortable in your environment by tapping into nature's inherent calming powers.

Sports fields

Sports fields, also commonly known as pitches, are the regulated areas for playing a variety of unique sports. Giving form to the rules of each game, sports fields are defined by their field of play which includes lines for out-of-bounds areas and penalties, but doesn't include ancillary functions such as spectator seating or team areas. Depending on the sport, pitches can vary in surface composition from grass to artificial turf, sand, clay, wood and concrete.

Playgrounds provide children with opportunities to imagine, explore, create and experience the world with all their senses. All of these actions enrich children's cognitive development, and the introduction of plants and other landscaping elements within a playground is a very simple and effective way to boost this process. Child-friendly plants and materials provide interesting colours, textures, fragrances and even sounds that stimulate nerve connections in the brain's pathways.

Urban furniture, such as benches, is important for people to relax. The design of urban furniture and the quality of the material used are significant here. The more user-oriented the design is, and the better the material is, the higher the quality of life of people will be. While pieces of street furniture meet the needs of its users in areas such as parks, gardens, squares, they are also used for landscaping purposes in the interiors of the buildings.

Children play facilities Urban Furniture

Interior landscapes

Interior landscaping is the practice of designing, arranging, and caring for living plants in enclosed environments. The beauty of interior landscaping is the limitless selection of trees and shrubs which flourish in a climate controlled environment. Our aim is to create an indoor landscape that brings life an otherwise cold space.

Interior landscaping in a built environment brings positive results, from physical health to mental health. It helps to build up a better working and living environment while increasing productivity.

Smart pot system reduces plant care to a minimum level, allowing people everywhere to experience how nature can thrive and remain protected in its most beautiful form for years to come. And finally, we should about sustainability. We promote your success by continuously improving our proven products and introducing intelligent solutions to our successful product lines to offer you even more decorative freedom in creative plantscaping.

The sub-irrigation system

- 1 Water level indicator**
Ensures complete watering control
- 2 Water supply shaft**
Makes adding water and liquid fertilizer easy
- 3 LECHUZA-PON as a separating layer**
Perfectly controls the water supply to the plants
- 4 Separator**
Forms the water reservoir in the bottom of the planter
- 5 Drain plug**
Is removed to allow excess rainwater to drain when used outdoors.

Smart Pots
